

NeoCarbon

CARBON ACCOUNTING & EMISSIONS
INTELLIGENCE FOR OIL & GAS

SAME INDUSTRY.
DIFFERENT
POSSIBILITIES.

From operational data to real climate impact.

NeoCarbon is a next-generation platform built for the oil & gas industry, turning your emissions data into accurate insights, regulatory-ready reports and a clear path to lower your carbon footprint.

More than
data.
Real control.

ONE PLATFORM.

FULL VISIBILITY.

REAL ACTION.

BUILT FOR THE REALITIES OF OIL & GAS

ACCURACY YOU CAN TRUST

Engineering formulas, custom fuel compositions and advanced calculation engines — not just default factors.

OGMP 2.0 READY

Dedicated methane emissions tracking, source-level reporting and continuous improvement workflow.

ALL YOUR DATA. ONE PLACE.

From wells to terminals, covering every asset, facility and emission source.

MORE INSIGHTS. LESS UNCERTAINTY.

Scenario analysis, trends, intensity metrics and forward-looking planning tools.

DESIGNED FOR A LOW-CARBON FUTURE

Meet regulatory demands, improve operational efficiency and stay ahead in the energy transition.

YOUR EMISSIONS DATA
DESERVES A SMARTER PLATFORM.

EXPLORE WHAT'S POSSIBLE →

NeoCarbon

CARBON ACCOUNTING & EMISSIONS
INTELLIGENCE FOR OIL & GAS

REAL ASSETS.
REAL EMISSIONS.
REAL INSIGHTS.

Complete coverage. From wellhead to flare.

NeoCarbon gives you the full picture of your oil & gas operations, with industry-specific tools, advanced calculations and OGMP 2.0 readiness — so you can measure, manage and reduce your emissions with confidence.

FULL OIL & GAS COVERAGE

Upstream (production)

Wells, gathering,
compression, processing

Midstream (transport & storage)

Pipelines, terminals,
storage, loading

Downstream (refining & distribution)

Refineries, petrochemicals,
products, logistics

All emission sources

Fugitive, combustion,
venting, flaring, leaks,
other

THE NEOCARBON ADVANTAGE

Advanced Calculation Engine

Engineering formulas,
custom fuel compositions,
regional factors.

Comprehensive Emissions Reporting

Scopes 1, 2 & 3,
regulatory-ready formats
(ISO 14064, API, EU, etc.).

Scenario & Planning Tools

What-if scenarios,
abatement options,
transition pathways.

OGMP 2.0 Ready

Tier 1, 2 & 3 reporting,
methane source tracking,
continuous improvement.

Methane Intelligence

Leak detection, LDAR,
source attribution,
intensity metrics.

Data Integration & Flexibility

Connect your systems,
import/export, API, manual
or automated data flows.

HOW NEOCARBON COMPARES

FEATURE	NeoCarbon	Other Industry Software	Specialized Methane Tools	Spreadsheets
Full oil & gas coverage (upstream → downstream)	✓	Partial	Partial	✗
Engineering formulas & custom factors	✓	Partial	✗	✗
OGMP 2.0 ready (Tier 1/2/3)	✓	Partial	Partial	✗
Methane source-level tracking	✓	Partial	Limited	✗
Regulatory reporting (ISO 14064, API, EU, etc.)	✓	Partial	✗	✗
Scenario & mitigation planning	✓	Limited	✗	✗
Real-time / continuous monitoring	✓	Limited	Partial	✗
Integrated dashboard & analytics	✓	Partial	Partial	✗
Flexibility & customization	✓	Limited	Limited	✗

BUILT FOR THE OIL & GAS INDUSTRY.

Not a generic tool.
NeoCarbon is designed
around your operations,
your data and your
emissions reality.

OGMP 2.0 — MORE THAN A STANDARD.

Be ready for what's next. NeoCarbon helps you:

Track methane
at the source

Meet OGMP 2.0
reporting requirements

Improve data quality
and transparency

Build a credible
reduction roadmap

Smarter data. Lower emissions. A stronger tomorrow.

NeoCarbon

OIL & GAS GHG INTELLIGENCE PLATFORM

Not just a reporting tool. An emissions calculation engine built around your operations.

NeoCarbon connects operational activity data to engineering-grade greenhouse-gas calculations, methane accounting, reporting and decision support across the upstream, midstream and downstream value chain.

One calculation architecture

Tier 1 · Tier 2 · Tier 3

Use default factors, regional references or engineering-based calculations according to the available operational data.

Source-level detail

Well → Facility → Source

Keep the relationship between input data, method, factor, calculation and reported result visible.

WHAT MAKES NEOCARBON DIFFERENT

01 / CALCULATION

Engineering-based formulas

Composition, operating data and physical properties can drive process-specific calculations instead of generic factors alone.

02 / FACTORS

Flexible factor hierarchy

IPCC, API and regional references with factor provenance, units, source information and conversion logic.

03 / TRACEABILITY

Input → calculation → result

Preserve calculation lineage so every reported result can be traced back to operational inputs.

04 / METHANE

OGMP 2.0-oriented workflow

Organize methane data at source level for quantification, reporting, tracking and improvement.

05 / COMPOSITION

Custom fuel & gas composition

Represent real gas and fuel compositions and calculate constituent-specific emissions where data exists.

06 / CONTROL

Audit history & change tracking

Track changes to inventory data and calculation inputs for reproducibility and review.

BUILT AROUND OIL & GAS EMISSION SOURCES

Stationary combustion

Boilers Furnaces Turbines Heaters Generators

Fuel quantity, composition, heating value and appropriate factors.

Flaring & venting

Routine Non-routine Associated gas Liquids unloading

Track volumes, composition and source information for methane and CO₂e accounting.

Fugitive & equipment emissions

Valves Compressors Pumps Connectors LDAR

Equipment-level source inventories and methane monitoring workflows.

Complete operational chain

Production Processing Transport Refining

Organize assets, facilities and sources across the value chain.

FROM RAW DATA TO DECISION-READY INTELLIGENCE

The calculation pipeline

Input → Conversion → Tier / Method → Factor / Formula → CO₂ / CH₄ / N₂O →

CO₂e

- Scopes 1, 2 and 3 architecture.
- Carbon, methane and flaring intensity.
- Dashboard, Excel and PDF reporting.
- Scenario and mitigation analysis.

Platform capabilities

- Multi-asset and multi-facility inventories.
- API, manual and import workflows.
- Calculation and inventory auditability.
- ISO 14064-oriented reporting.
- CBAM-related data workflows.
- Local deployment option for data control.

Not just a reporting tool.

The emissions calculation engine built around your operations.

NeoCarbon connects operational activity data to engineering-grade greenhouse-gas calculations, speciated methane accounting, reporting and verifier-ready decision support across the upstream, midstream and downstream value chain.

One calculation architecture

Tier 1 • Tier 2 • Tier 3

Use default factors, regional references or engineering-based calculations according to available operational data fidelity.

Source-level detail

Well → Facility → Source

Keep the relationship between input data, method, factor, calculation and reported result fully visible and auditable.

WHAT MAKES NEOCARBON DIFFERENT: 6 FUNCTIONAL MODULES

01 / CALCULATION

Engineering-based formulas

API Compendium 2021 algorithms, flash EOS, and physical properties drive process calculations instead of generic factors.

02 / REPORTING

Comprehensive multi-scope

Scopes 1, 2 and 15 Scope 3 tiers. 1-click verified export packages for ISO 14064, EU CBAM, and corporate CSRD formats.

03 / SCENARIOS

Scenario & planning tools

What-if simulation, Marginal Abatement Cost Curves (MACC), flare gas monetization payback, and VRU capital returns.

04 / METHANE

OGMP 2.0 Gold workflow

Component-level source tracking, bottom-up LDAR reconciliation with drone/satellite scans, and continuous reduction roadmaps.

05 / COMPOSITION

Custom fuel & gas composition

Represent real gas chromatography (C1-C6+, CO₂, N₂, H₂S) and calculate constituent-specific mass emissions where data exists.

06 / CONTROL

Audit history & air-gapped security

Full lineage traceability with SHA-256 audit seals. 100% on-premise air-gapped deployment option behind your firewall.

The Calculation Pipeline (Raw Data → Decision Intelligence)

Input → Conversion → Tier / Method → Factor / Formula → CO₂ / CH₄ / N₂O → CO₂e

- Scopes 1, 2 and 3 architecture across all operational entities.
- Carbon, methane and flaring intensity metrics (tCO₂e/boe).
- Direct SCADA/historian telemetry & automated ingestion connectors.
- Dashboard, Excel and PDF reporting ready for DNV/KPMG audit.

Built Around Oil & Gas Emission Sources

Stationary combustion
Boilers Turbines Heaters Generators
Fuel quantity, heating value and stoichiometric combustion factors.

Fugitive & LDAR
Valves Pumps Compressors Flanges
Component-level inventories and methane screening workflows.

Flaring & venting
Routine Non-routine Gas Flaring
Unloading
Destruction efficiency (DRE), volume and gas composition modelling.

Complete value chain
Production Processing Pipelines
Refining
Organize assets, joint ventures and facilities across operations.

HOW NEOCARBON COMPARES

FEATURE / CAPABILITY	NeoCarbon	Other Industry Software	Specialized Methane Tools	Spreadsheets
Full oil & gas coverage (upstream → downstream)	✓ Comprehensive	Partial	Partial	X
Engineering formulas & custom factors (Tier 3)	✓ Full Physics	Partial	X	X
OGMP 2.0 ready (Tier 1/2/3 & Gold Standard)	✓ Built-in Gold L5	Partial	Partial	X
